

## Information for Consumers - Stress Fracture (Suspected)

This article tells you about suspected stress fracture, including what imaging tests you may need to have.

### What is a stress fracture?

Stress fractures are tiny cracks in your bones, caused by overuse of muscles in the body. When muscles are overused they become tired and cannot take the shock from repeated impacts like running and jumping. The stress from this then causes the tiny cracks in the bones.

### Diagnosis

If your doctor thinks you may have a stress fracture, he/she will request plain x-rays of the painful area. If the x-rays are positive your doctor will start treatment. If the x-rays are negative, your doctor may request a

- Nuclear medicine bone scan
- MRI scan
- CT scan
- Or a repeat plain x-rays after about 1 month

This will help the doctor to decide what is causing your pain and what type of treatment you need.

### Results

A radiology doctor will look at your scans and write a report for your doctor.

### Further information
